

## Listing of Claims

1. (CURRENTLY AMENDED) Method A method for the ~~modulation~~ modulating of a multicarrier signal with a density  $1/(v_0 \cdot \tau_0) = 2$ , formed by successive symbols, each comprising M samples to be transmitted and constituted by a set of 2M orthogonal carrier frequencies in the real sense, the interval between two neighboring carrier frequencies being equal to  $v_0$  and the interval between the times of transmission of two consecutive symbols, or the symbol time, being equal to  $\tau_0$ , each of said carrier frequencies being modulated according to one and the same modulation prototype function  $g(t)$  with a truncation length of  $2L\tau_0$ , L being an integer representative of said truncation length, ~~characterized in that it comprises~~ comprising, at each symbol time, the following steps:

- ~~the obtaining of~~ a set of 2M complex coefficients representing data to be transmitted;
- ~~the computing of~~ 2LM linear combinations from said 2M complex coefficients obtained, ~~the weighting coefficients used in these said combinations~~ using weighting coefficients representing said prototype function  $g(t)$ , so as to obtain 2LM coefficients;
- ~~the summing of~~ said 2LM coefficients weighted in ~~the~~ predetermined storage locations of a memory comprising 2LM storage locations representing 2L groups of M distinct partial sums, so as to gradually form, in said 2LM storage locations, over a duration of  $2L\tau_0$ , M samples to be transmitted; and
- ~~the transmission-transmitting of~~ said samples to be transmitted.

2. (CURRENTLY AMENDED) Method of modulation according to claim 1, ~~characterized in that wherein~~ a sample to be transmitted at the instant  $j\tau_0 + k\tau_0/M$ , referenced  $s_{k+jM}$  is written as follows:

$$s_{k+jM} = \sum_{q=0}^{2L-1} [\alpha_{k,q} C_{k,j-q} + \beta_{k,q} C_{k+M,j-q}]$$

where:  $C_{0,j}$  to  $C_{2M-1,j}$  are the 2M complex coefficients generated between the instants  $j\tau_0$  and  $(j+1)\tau_0$ ;

$\alpha_{k,q}$  and  $\beta_{k,q}$  are said weighting coefficients.

3. (ORIGINAL) Method of modulation according to claim 2, characterized in that:

- $\alpha_{k,q} = 0$  for  $q$  as an odd parity number;
- $\beta_{k,q} = 0$  for  $q$  as an even parity number.

4. (CURRENTLY AMENDED) Method of modulation according to claim 3, ~~characterized in that it comprises~~ comprising, for ~~the~~ a generation of a symbol with an index  $j$  formed by  $M$  samples, the following steps:

- ~~the obtaining of~~ 2M real inputs  $a_{m,n}$  representing a source signal;
- ~~the pre-modulation~~ modulating of each of said real inputs producing 2M complex coefficients;
- ~~the reverse Fourier~~ transforming ~~transform~~ of said 2M complex coefficients producing 2M complex transformed coefficients  $C_{0,j}$  to  $C_{2M-1,j}$ ;
- for each of the  $M$  pairs  $(C_{k,j}, C_{(k+M),j})$  of said transformed coefficients, ~~the computation~~ computing of 2L weighted coefficients, the weighing coefficients representing said prototype function;
- ~~the addition of~~ summing the result of each of said weighted 2LM values to the contents of the 2LM distinct memory zones so as to gradually build the samples to be transmitted constituting the symbols  $j, (j+1), (j+2), \dots (j+2L-1)$ ; and
- ~~the sending of~~  $M$  samples corresponding to the  $M$  oldest contents of said memory zones and then ~~the~~ resetting of the contents of said  $M$  memory zones.

5. (CURRENTLY AMENDED) Method of modulation according any of the claims 1 to 4, ~~characterized in that~~ wherein said steps are implemented at the rate  $\tau_0/M$  of the samples.

6. (CURRENTLY AMENDED) Method of modulation according to any of the claims 1 to 5, ~~characterized in that~~ wherein said transmission step is followed by a step for the updating of said memory locations comprising:

- a physical shifting of the contents of each of said memory locations if the latter are elements of a shift register; or
- ~~an~~ updating of the write and read addresses of said memory locations, if the latter are elements of a RAM.

7. (CURRENTLY AMENDED) Method of modulation according to any of the claims 1 to 6, ~~characterized in that wherein~~ said coefficients representing data elements to be transmitted are obtained by the implementation of a mathematical transform comprising the following steps:

- ~~the application applying~~ of a real reverse Fourier transform;
- the circular permutation of the result of this reverse transform by M/2 coefficients leftwards; and
- ~~the multiplication multiplying~~ of each of said coefficients by  $i^n$ .

8. (CURRENTLY AMENDED) Method of modulation according to any of the claims 1 to 7, ~~characterized in that wherein~~ the signal centered on the frequency  $Mv_0$  is written as follows:

$$s(t) = \sum_n \sum_{m=0}^{2M-1} a_{m,n} (-1)^{m(n+L)} i^{m+n} e^{2i\pi m v_0 t} g(t - n\tau_0)$$

9. (CURRENTLY AMENDED) A device for the modulation-modulating of a multicarrier signal with a density  $1/(v_0 \tau_0) = 2$ , formed by successive symbols, each comprising M samples to be transmitted and constituted by a set of 2M orthogonal carrier frequencies in the real sense, the interval between two neighboring carrier frequencies being equal to  $v_0$  and the interval between the times of transmission of two consecutive symbols, or the symbol time, being equal to  $\tau_0$ , each of said carrier frequencies being modulated according to one and the same modulation prototype function  $g(t)$  with a truncation length of  $2L\tau_0$ , ~~characterized in that it comprises~~ said device for modulating comprising:

- means for ~~the~~ temporary storage of 2M groups of M partial sums in temporary storage locations;
- means for ~~the~~ weighting of 2M complex coefficients representing data elements to be transmitted by weighting coefficients representing said prototype function  $g(t)$ ; and
- means for ~~the~~ summing of the weighted coefficients in respective predetermined memory locations of said temporary storage locations, so as to gradually form said samples to be transmitted on a duration of  $2L\tau_0$ .

10. (CURRENTLY AMENDED) ~~Modulation~~ A device for modulating according to claim 9, characterized in that it comprises:

- means of mathematical transformation delivering said coefficients representing data elements to be transmitted at the rate  $\tau_0/2M$  and in the following order  $(C_{0,j}, C_{M+1,j}), \dots (C_{M-1,j}, C_{2M-1,j})$ ;
- storage means including  $2LM-M$  simultaneous read/write RAM type memory locations; and
- $N$  complex multipliers working at the rate  $N\tau_0/2LM$ ,  $N$  being equal to 1, 2, 4, ... or  $2L$ .

11. (CURRENTLY AMENDED) ~~Method~~ A method for the demodulation-demodulating of a received signal corresponding to a transmitted multicarrier signal with a density  $1/(v_0 \cdot \tau_0) = 2$ , formed by successive symbols, each comprising  $M$  samples to be transmitted and constituted by a set of  $2M$  orthogonal carrier frequencies in the real sense, the interval between two neighboring carrier frequencies being equal to  $v_0$  and the interval between the times of transmission of two consecutive symbols, or the symbol time, being equal to  $\tau_0$ , each of said carrier frequencies being modulated according to one and the same modulation prototype function  $g(t)$  with a truncation length of  $2L\tau_0$ , ~~characterized in that~~ wherein an estimation of  $2M$  real data elements transmitted at a given symbol time is reconstituted by means of the following steps:

- ~~the sampling of~~ said signal received at the sample frequency  $\tau_0/M$ , delivering  $M$  complex samples received;
- ~~the storage~~ storing of each of said  $M$  complex samples received in a predetermined location of an input memory comprising  $2ML$  complex locations, in which there have been previously memorized  $(2L-1)M$  samples received during the ~~2L~~  $2L-1$  previous symbol times;
- ~~the multiplication of~~ multiplying the  $2ML$  values contained in said input memory by coefficients representing said prototype function;
- temporal aliasing, by ~~the summing up of~~  $2M$  series of  $L$  results of ~~multiplication~~ the multiplication step, so as to obtain  $2M$  complex values; and
- ~~the processing of~~ said  $2M$  complex values to form said estimations of the  $2M$  real data elements transmitted.

12. (CURRENTLY AMENDED) Method for demodulating ~~A demodulation method~~ according to claim 11, ~~characterized in that the~~ wherein  $2M$  complex values derived from the temporal aliasing step between the instants  $(j+2L-1)\tau_0$  and  $(j+2L)\tau_0$  are written as follows:

$$R_{k,j} = \sum_{q'=0}^{2L-1} \alpha'_{k,q} r_{k'+(j+q')M}$$

$$R_{k+M,j} = \sum_{q'=0}^{2L-1} \beta'_{k,q} r_{k'+(j+q')M}$$

where:

$r_{k'+(j+q')M}$  represents the sample received at the instant  $k'\tau_0+(j+q')\tau_0/M$ ;  
 $\alpha'_{k,q}$  and  $\beta'_{k,q}$  are said weighting coefficients.

13. (CURRENTLY AMENDED) ~~Demodulation method~~ Method for demodulating according to ~~any of the claims~~ claim 11, characterized in that wherein:

- $\alpha'_{k,q} = 0$  for  $q'$  as an odd parity value;
- $\beta'_{k,q} = 0$  for  $q'$  as an even parity value.

14. (CURRENTLY AMENDED) Method for demodulating according to ~~any of the claims~~ claim 11, characterized in that wherein said processing step comprises the following steps:

- ~~the application~~ applying of a mathematical transformation that is the reverse of the one performed during the modulation on said  $2M$  complex values delivering  $2M$  transformed values;
- ~~the correction of~~ correcting phase and/or amplitude distortions due to the transmission channel; and
- ~~the extraction of~~ extracting the real part of said transformed complex values.

15. (CURRENTLY AMENDED) ~~Demodulation method~~ Method for demodulating according to ~~any of the claims~~ claim 11, characterized in that wherein said steps are implemented at the rate  $\tau_0/M$  of the samples.

16. (CURRENTLY AMENDED) Device for ~~the demodulation~~ demodulating of a received signal corresponding to a transmitted multicarrier signal with a density  $1/(v_0 \cdot \tau_0)=2$ , formed by successive symbols, each comprising  $M$  samples to be transmitted and constituted by a set of  $2M$  orthogonal carrier frequencies in the real sense, the interval between two neighboring carrier frequencies being equal to  $v_0$  and the interval between the times of transmission of two consecutive symbols, or the symbol time, being equal to  $\tau_0$ , each of said carrier frequencies being

modulated according to one and the same modulation prototype function  $g(t)$  with a truncation length of  $2L\tau_0$ , ~~characterized in that it comprises~~ said device for demodulating comprising:

- means for ~~the~~ sampling of said received signal;
- means for ~~the~~ temporary storage of the complex samples ~~sample functions~~ comprising  $2ML$  complex locations;
- means for ~~the multiplication~~ multiplying of said ~~memorized complex~~ samples by weighting coefficients representing said prototype function;
- temporal aliasing means summing up  $L$  weighting results so as to obtain  $2M$  complex values; and
- means for ~~the~~ processing of said complex values delivering an estimation of  $2M$  real data elements transmitted at each symbol time.

17. (CURRENTLY AMENDED) ~~Demodulation~~ A device for demodulating according to claim 16, characterized in that it comprises:

- means of mathematical transformation that is the reverse of the transformation performed during the modulation on said  $2M$  complex values;
- means for ~~the~~ correction of phase and/or amplitude distortions due to the transmission channel; and
- means for ~~the extraction~~ extracting of the real part of said transformed complex values.

18. (CURRENTLY AMENDED) ~~Demodulation~~ A device for demodulating according to any of the claims 16 and 17, ~~characterized in that it comprises~~ comprising:

- storage means comprising  $2ML-M$  simultaneous write/read RAM type complex memory locations;
- $N$  complex multipliers working at the  $N\tau_0/2LM$  rate, where  $N$  is equal to 1, 2, 4 ... or  $2L$ ; and
- means of mathematical transformation working at the  $\tau_0/2M$  rate, whose inputs  $R_{0,j}$  to  $R_{2M-1,j}$  are read in the order  $(R_{0,j}, R_{M,j}), (R_{1,j}, R_{M+1,j}), \dots (R_{M-1,j}, R_{2M-1,j})$ .

19. (CURRENTLY AMENDED) A filtering method delivering series of  $M$  complex output values at regular intervals from  $2L$  series of  $2M$  complex input values, said  $M$  complex values corresponding to a weighted sum of  $2L$  of said complex input values to be processed,

characterized in that it comprises said filtering method comprising the following steps for each series of complex input values:

~~the computation~~ computing of  $2LM$  linear combinations from said  $2M$  complex ~~coefficients~~ input values obtained, the weighting coefficients being derived from  $2L$  complex or real filters with a size  $M$ , so as to obtain  ~~$2LM$  coefficients~~  $2ML$  values;

- ~~the~~ summing of each of the ~~weighted~~  $2ML$  values in a predetermined memory location out of a set of  $2ML$  memory locations each containing a partial sum so as to gradually form said output values in said  $2ML$  memory locations on a period corresponding to the reception of  $2L$  series of complex input values.

---
